Receive calls & SMS undetected. Untraceable VOIP - unlimited numbers, no more burners
Many people are wasting money on prepaid cell phones and SIM cards. This is a good method, but there is a more effective trick, and it allows you to receive calls 24/7 while being 100% untraceable. I do that since I started carding, in fact I never got a SIM card and I have near 100% success rate in carding.

You will be able to call and receive calls, all from home. Here's the trick.

You will need:
- 1 physical VoIP phone (you can "buy" one for around $60 online, or card it at http://www.voipsupply.com/voip-phones)

- 1 RingCentral account (card it at   www.ringcentral.com/)

Step 1) Make your router connects with VPN instead of Dynamic IP

- A router that supports VPN connection (pretty much any TP-Link, Dlink, Linksys in houses support it unless you have a VERY old one) (you can card it too)

Your ISP told you to configure the WAN of your router to use Dynamic IP. It works. But you can select VPN instead. I suggest PureVPN as I've been totally successful with them. So now that your router uses VPN for the Internet connection, ALL traffic between you and the outside is encrypted. This includes laptops, computers, iphones... everything on your network. Your ISP can't snitch on you. Yep, putting the VPN setting directly in your router.
If you don't know how to configure the WAN connection type of your router, Google it.
Make sure your Internet works after doing that.

Step 2) Create an account on RingCentral

RC is my favorite platform for that. They are easy to card (although they sometimes ask for you to call them to set the account for the first time), and it allows you to have an unlimited number of phone numbers pointing to the same place, all with different voicemails. Useful to impersonate your cardholder. You can select the state / city and get a local number, and make them point to the same place, i.e. your VoIP phone. So create an account.
Plus, they have free phone support to configure if you need help.

Step 3) Configure your VoIP phone

RingCentral will give you the parameters to put in your phone (I recommend the Aastra brand as they are good). This includes your phone number, user, password. All your burner numbers will point to the same number, so you never need to touch the configuration again. Make sure your phone is configured and works. Make a few test calls to ensure your phone is up and running.

You now have a phone that works through your VPN, making it completely untraceable. You can leave it on 24/7. If the bank investigates the phone number, they will see it is with RingCentral. Who's the owner of the account? Some dude that got his card stolen. Where are the VoIP connections originating from? A VPN server... let's go eat donuts.

This way, you can receive calls from the bank or the merchants without any problem and

Receive calls & SMS undetected. Untraceable VOIP - unlimited numbers, no more burners without being traceable. You never need to change phone or to reconfigure it. Just add a phone number when you have a new card to ATO or to put a contact phone number.

Everyday, my phone rings and it's the fraud department of a bank wanting to verify transactions. I take the call and confirm everything. Piece of cake.

Now, NEVER make calls unrelated to carding with that phone. You don't want your RC account to contain bank numbers AND the number of your girlfriend, which may be a track to follow for LE. With all that, you will never get caught.
